

In re Application of MOORE et al.
Serial No. 09/742,795

Listing of the Claims:

1. (currently amended) A computer-implemented method, comprising:
at a client computer, obtaining information from a server about the
availability of at least one update and storing information about the availability in a
first storage location and obtaining information about the unavailability of at least
one update and storing the information about the unavailability in a second location
from a server;

storing the information about available and unavailable updates at a local
cache on the client computer; and

in response to a request for update information that may be available at the
server, accessing the local cache to retrieve the information about available
updates and unavailable updates.

2. (currently amended) The computer-implemented method of claim 1
wherein ~~downloading~~ obtaining the information includes accessing at least one
Internet website.

3. (currently amended) The computer-implemented method of claim 1
wherein obtaining the information about available updates from the server includes
obtaining data that changes the information about available updates in the local
cache.

In re Application of MOORE et al.
Serial No. 09/742,795

4. (previously presented) The computer-implemented method of claim 1 wherein storing the information about available updates includes storing data identifying whether a hardware device has a driver available for download from an online site.

5. (original) The computer-implemented method of claim 4 wherein at least some of the data identifying whether the driver is available for download is maintained in a bitmask.

6. (original) The computer-implemented method of claim 5 wherein the bitmask has a bit therein that indicates whether the driver may be available for download from an online site.

7. (original) The computer-implemented method of claim 6 wherein the bit is determined by hashing an identifier corresponding to the hardware device.

8. (original) The computer-implemented method of claim 6 wherein a setting of the bit indicates whether a file containing update information can be locally accessed.

9. (original) The computer-implemented method of claim 8 wherein the bit setting indicates that the file can be locally accessed, and further comprising,

In re Application of MOORE et al.
Serial No. 09/742,795

accessing the file, and searching for data therein corresponding to the hardware device.

10. (original) The computer-implemented method of claim 8 wherein the data corresponding to the hardware device is present and indicates a version number of an available driver for that hardware device.

11. (original) The computer-implemented method of claim 1 wherein storing the information about available updates includes storing data identifying whether at least one software component is available for download from an online site.

12. (original) The computer-implemented method of claim 11 wherein at least one software component is available, and further comprising storing data identifying whether installation of at least one available software component is dependent on installation of at least one other software component.

13. (original) The computer-implemented method of claim 11 wherein at least one software component is available, and further comprising storing data identifying a version for at least one available software component.

14. (original) The computer-implemented method of claim 1 wherein accessing the local cache to retrieve the information about available updates

In re Application of MOORE et al.
Serial No. 09/742,795

indicates that an update is available, and further comprising, persisting information about the available update.

15. (original) The computer-implemented method of claim 14 further comprising, downloading updates at a time when a connection exists based on the information persisted about the available update.

16. (original) The computer-implemented method of claim 1 wherein accessing the local cache to retrieve the information about available updates indicates that an update is available, and further comprising, downloading the available update.

17. (currently amended) In a computing device, a system comprising,
network access software configured to access a network;
a cache;
a cache maintenance mechanism connected to the network access software and configured to maintain information in the cache, the information corresponding to available updates maintained on the network stored in a first data storage location and corresponding to unavailable updates not maintained on the network stored in a second data storage location; and
automatic update software connected to access the cache in response to a request for update information on the network, and to determine from the information in the cache whether an update is available or not available.

**In re Application of MOORE et al.
Serial No. 09/742,795**

18. (original) The system of claim 17 wherein the cache maintenance mechanism maintains information in the cache by downloading information into the cache from a network site.

19. (original) The system of claim 17 wherein the request for update information corresponds to a scheduled event.

20. (previously presented) The system of claim 17 wherein the automatic update software locates information about the update to a driver in response to a request for hardware-related updates.

21. (original) The system of claim 20 wherein the information about the update to the driver is included in a bitmask in the cache.

22. (previously presented) The system of claim 20 wherein the information about the update to the driver comprises an online update and is included in a file in the cache.

23. (original) The system of claim 17 wherein the information in the cache further includes driver includes version information for at least some of the available updates.

In re Application of MOORE et al.
Serial No. 09/742,795

24. (original) The system of claim 17 wherein the automatic update software determines whether at least one software component is available for download from the network.

25. (original) The system of claim 17 wherein the automatic update software determines that an update is available and persists information corresponding thereto.

26. (previously presented) The system of claim 17 wherein the automatic update software determines that the update is available and downloads the update from the network.

27. (currently amended) A computer-readable medium having computer executable instructions, comprising,

accessing an online source to obtain information related to available updates and information related to unavailable updates;

caching the information, the information including information as to the availability cached in a first cache storage location and the unavailability of updates cached in a second cache storage location;

receiving a request directed to whether a particular update is available for download from the online source; and

accessing the cache to determine whether the particular update is available or is not available for download from the online source.

**In re Application of MOORE et al.
Serial No. 09/742,795**

28. (original) The computer-readable medium of claim 27 wherein the online source is accessed via an Internet site.

29. (original) The computer-readable medium of claim 27 wherein the cache indicates that the particular update is available, and further comprising, downloading the update.

30. (original) The computer-readable medium of claim 27 wherein the cache indicates that the particular update is available, and further comprising, persisting information corresponding to the update for later download of the update.

31-34. (cancelled)
